

Redes Recurrentes

Las redes neuronales recurrentes (RNN) son un tipo de red neuronal diseñada para procesar datos secuenciales.

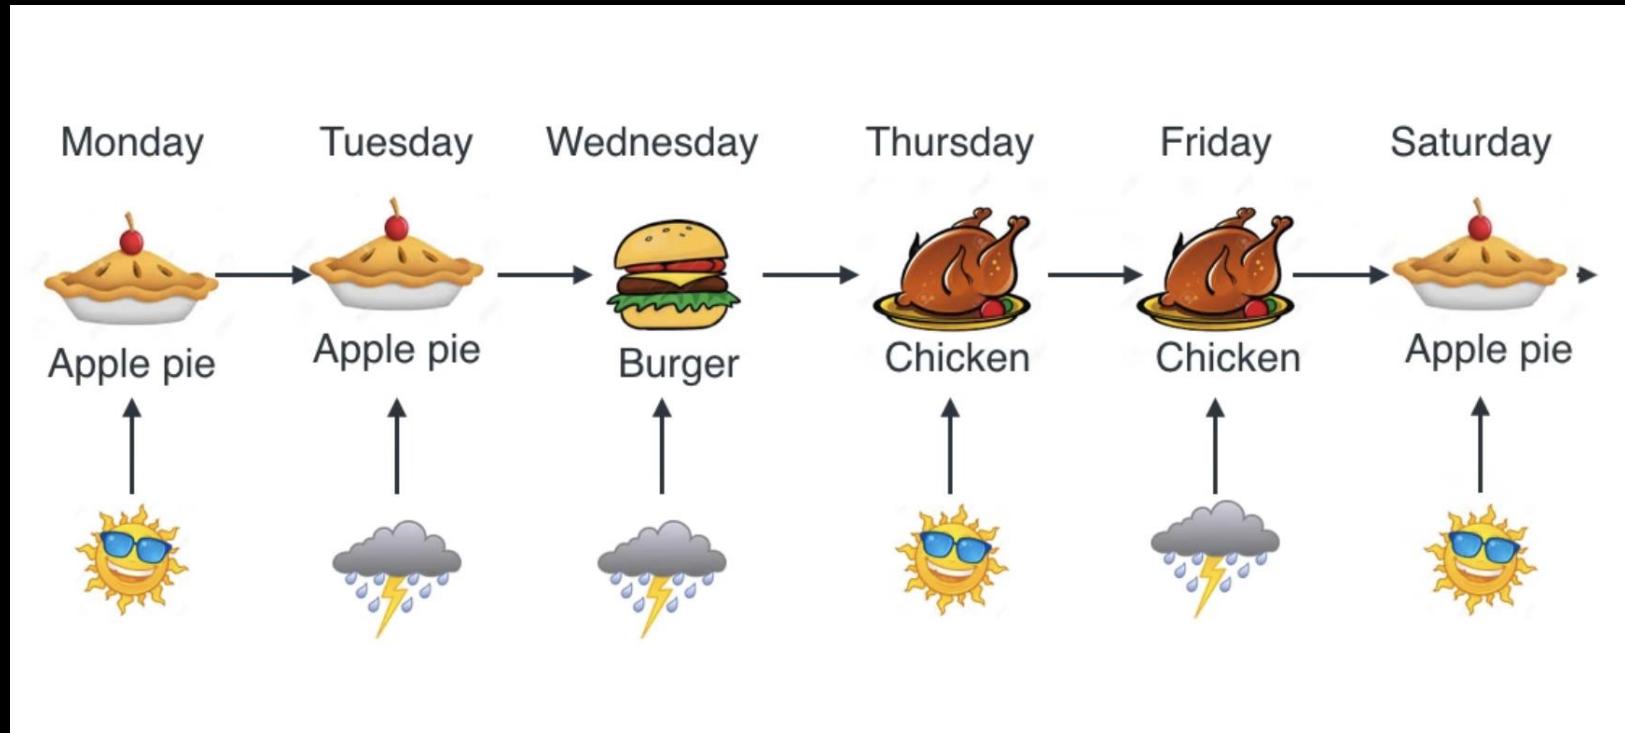

Ideal para problemas en los que la información de estados previos influye en la salida actual.

Permiten modelar dependencias temporales en series de tiempo, lenguaje y otras secuencias.

Como se decide el menu del dia?

Recurrent Neural Network

Recurrent Neural Network

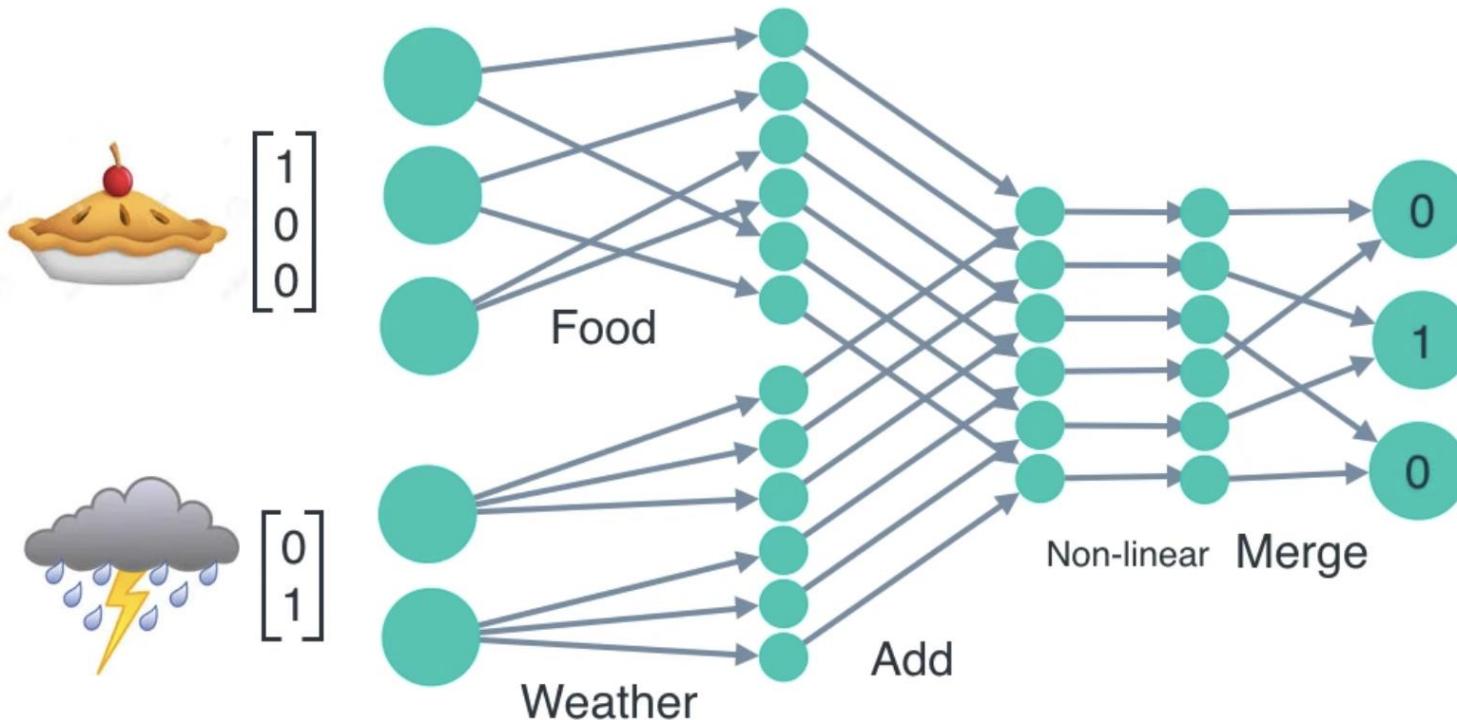

Recurrent Neural Network

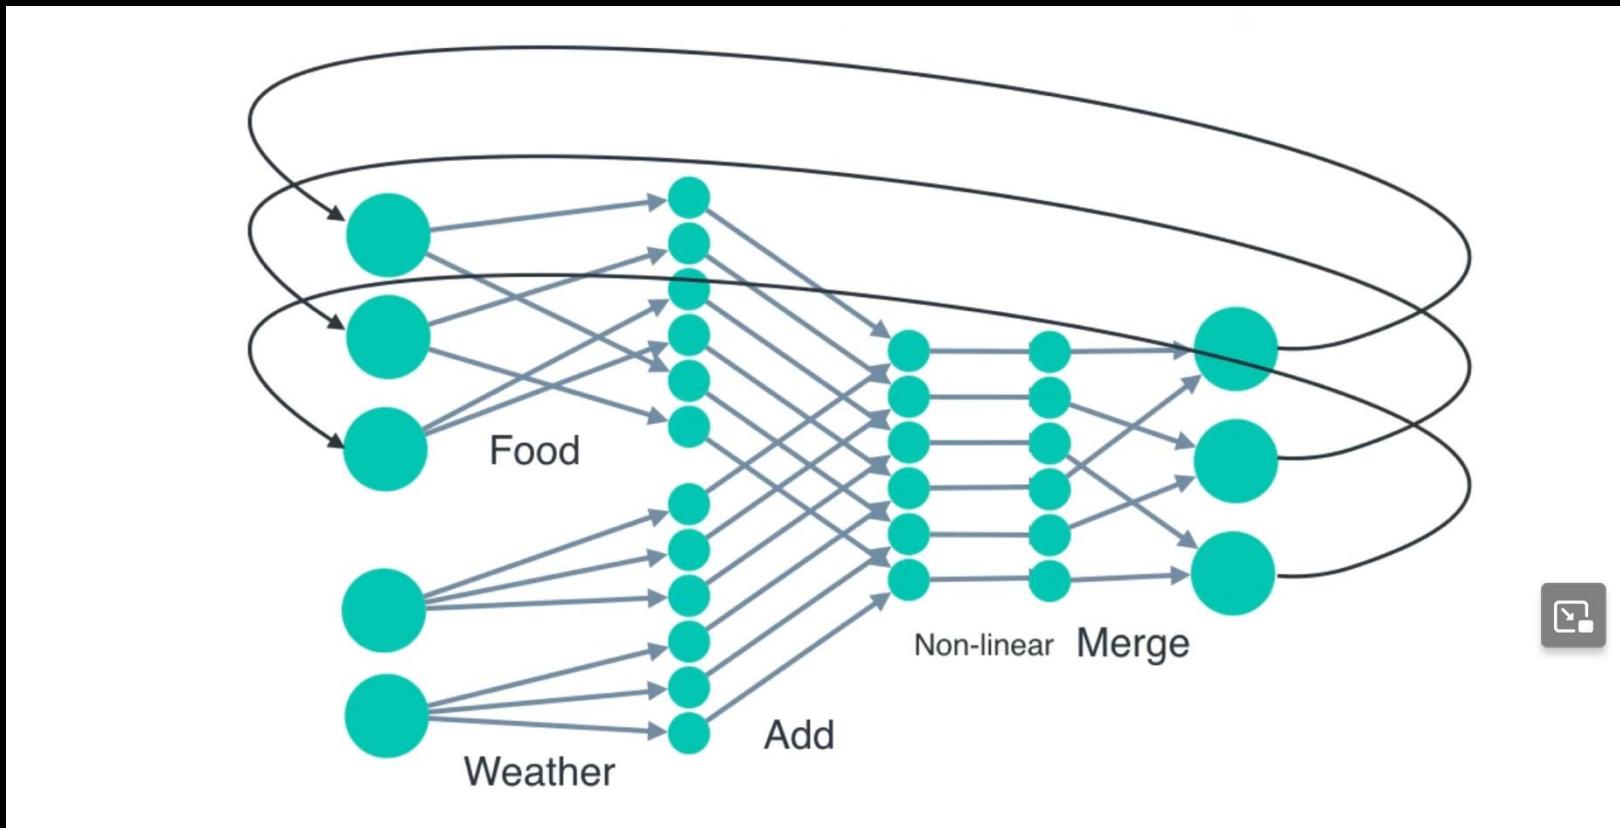

Recurrent Neural Network

$$MSE = \sum_1^9 (\hat{y}_i - y_i)^2$$

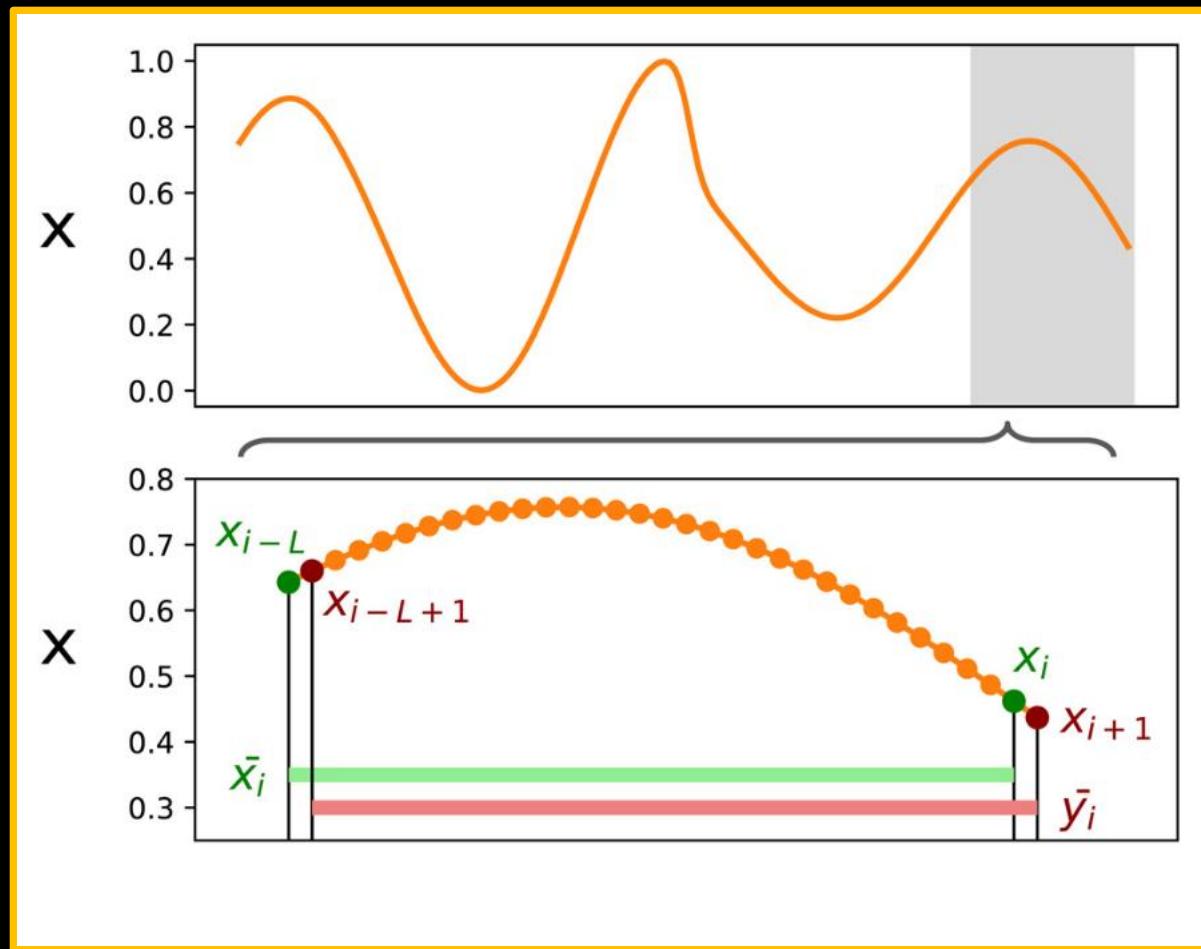

No tiene sentido y mas alla de la linea roja

Una señal temporal (vectorial) y punto...

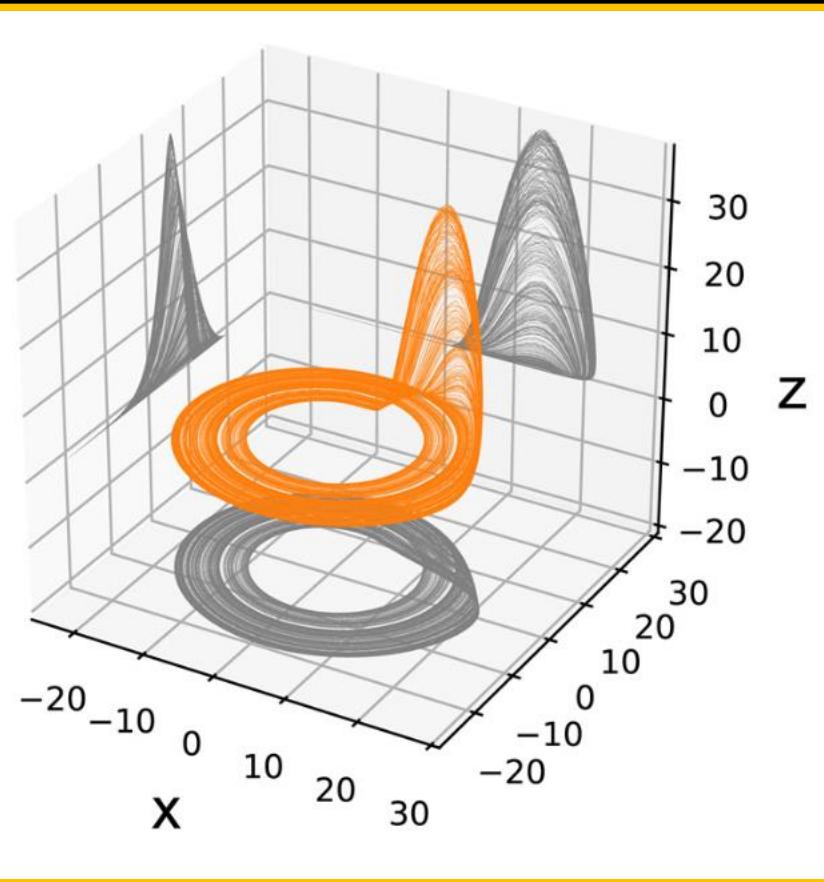

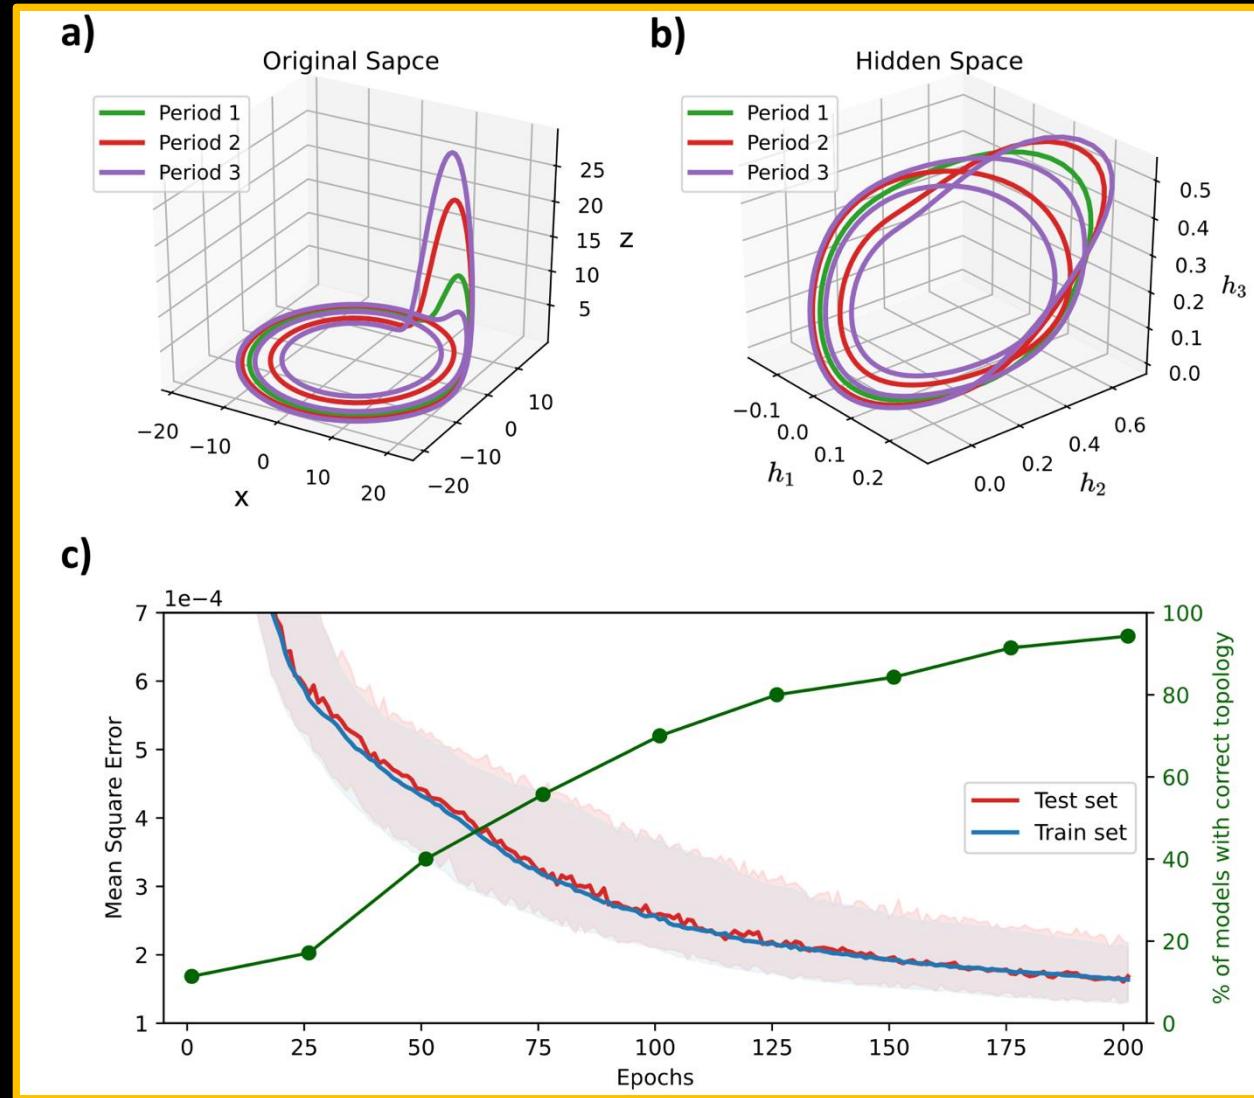

Mas bien unas cuarenta coordenadas, no 3, en este ejemplo...

$$\frac{dx}{dt} = -y - z$$

$$\frac{dy}{dt} = x + ay$$

$$\frac{dz}{dt} = b + z(x - c)$$

1) RNN Simple

```
model = Sequential()  
model.add(SimpleRNN(5, activation='tanh', input_shape=(look_back, n_features)))  
model.add(Dense(1,activation='linear'))  
model.compile(optimizer='adam', loss='mse')
```

Importante: Los datos de entrada deben tener la forma:

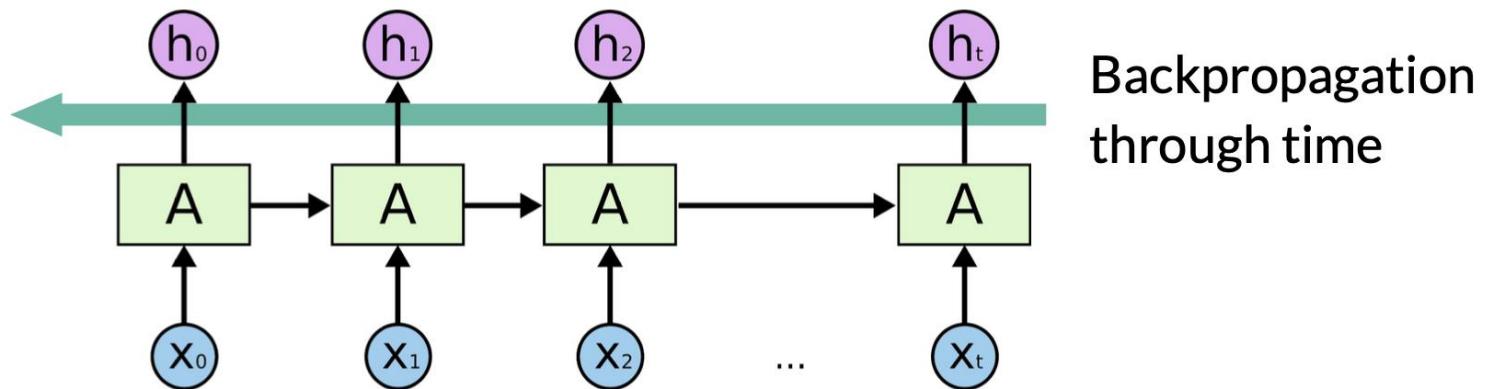

X.shape = [num_samples, look_back , n_features]

En la señal anterior, num_samples es del orden de 40000, los look back unos 40, y las features 1

1) RNN Simple

Vanishing gradient
problem

Problema! Les cuesta aprender dependencias de largo plazo.

Attention Is All You Need

Transformers... predicción, palabra por palabra.

La construccion de un embedding “semantico”

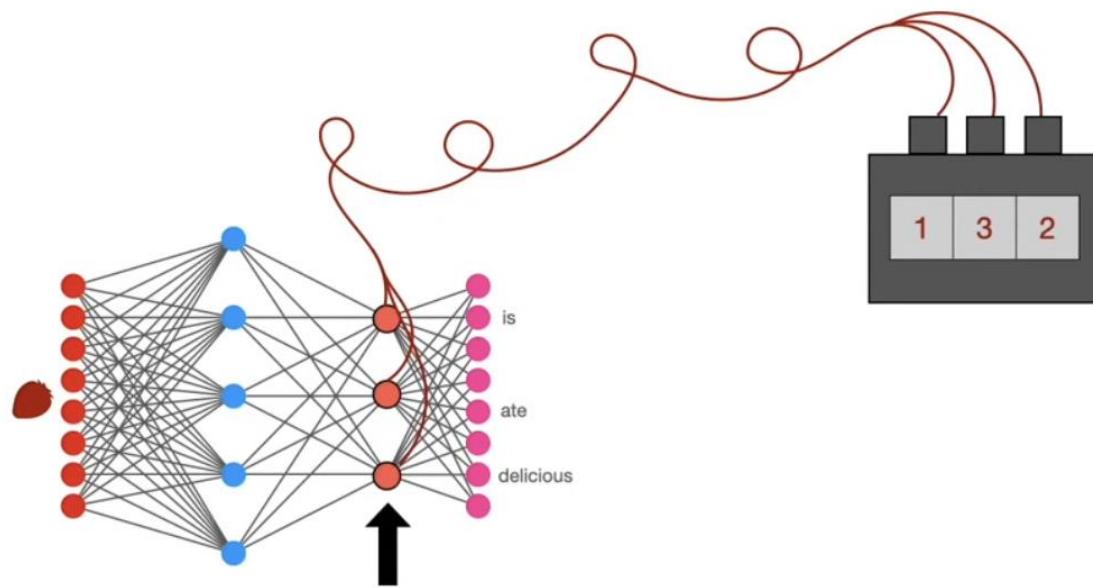

Sea una red “all to all”,
preparada para predecir la proxima palabra

I
Have
Spent
Time
With
My
Family
Therefore
I
am

Un modo de hacer embeddings

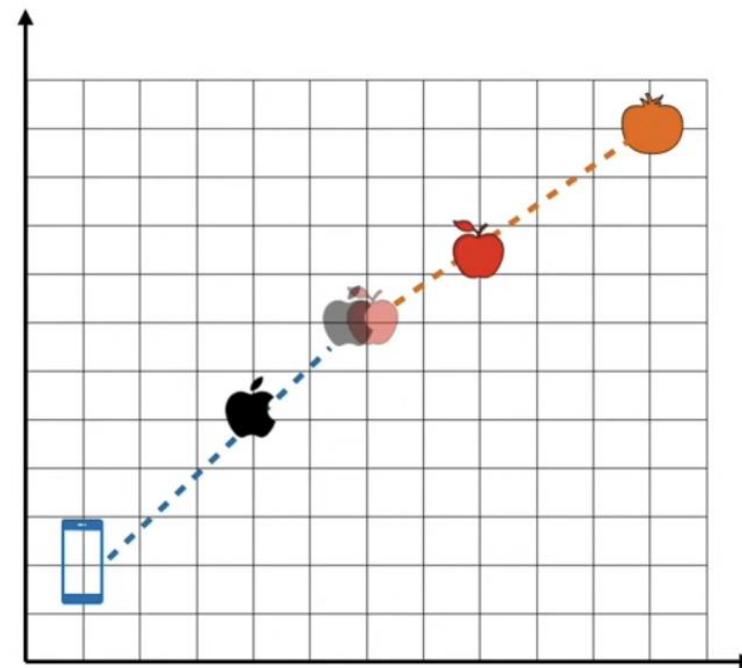

Representacion via los valores numericos de la capa anteultima

Word	Numbers		
Strawberry	1	3	2
Apple	1.1	2.9	2.2

Attention

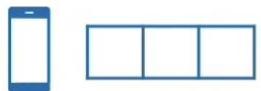

**Un modo de que las palabras sean afectadas por el contexto:
Alterar el embedding de las palabras segun las demas del contexto**

please buy an **apple** and an **orange**

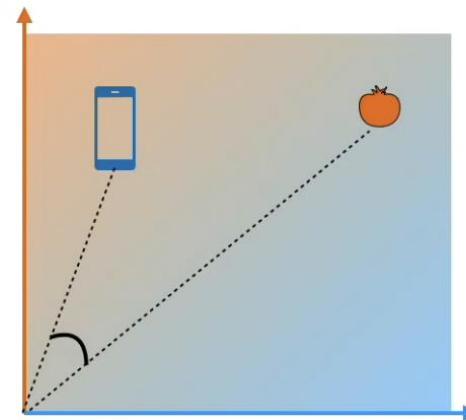

apple unveiled the new **phone**

Similarity

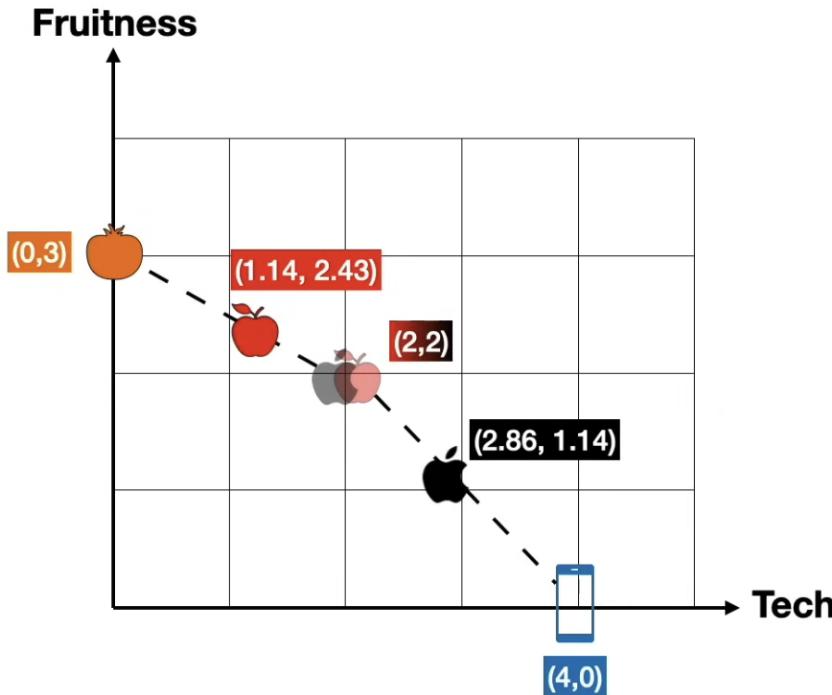

Similarity

(,) =

Attention refiere a moverse en el espacio de embedding
en la dirección que sugiera la similitud

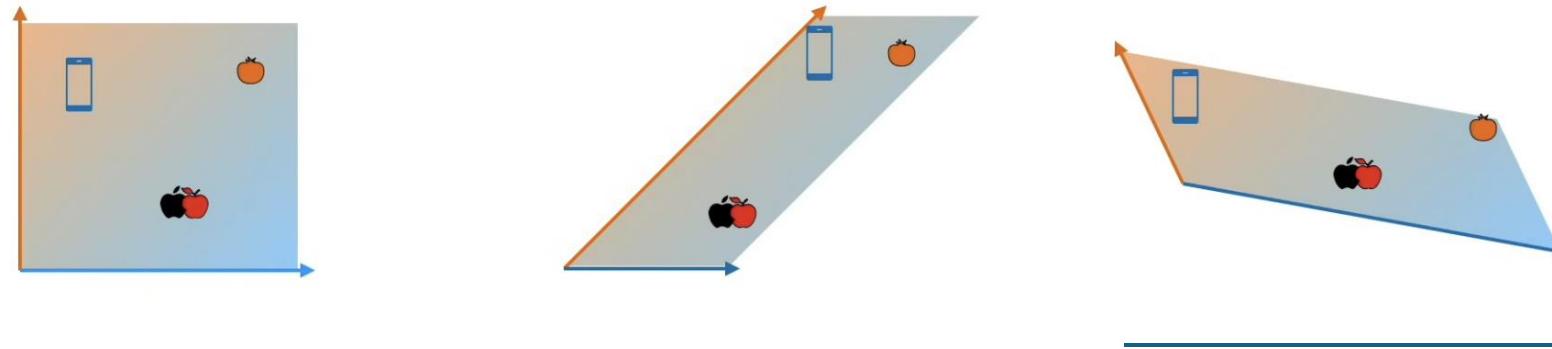

an **apple** and an **orange**

Apple → 0.43 **Orange** + 0.57 **Apple**

an **apple** phone

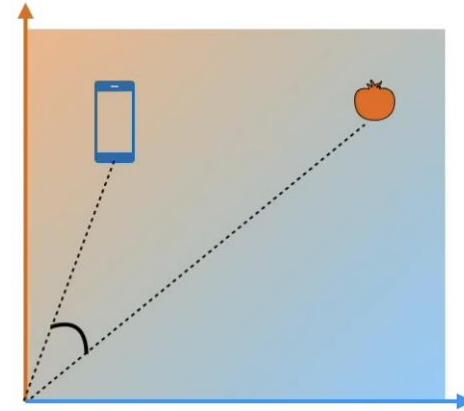

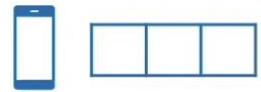

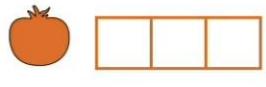

Apple → 0.43 **Phone** + 0.57 **Apple**

Ahora, para mover segun el contexto,
es mejor realizar una transformacion lineal

(donde el corrimiento funcione mejor)

Similarity

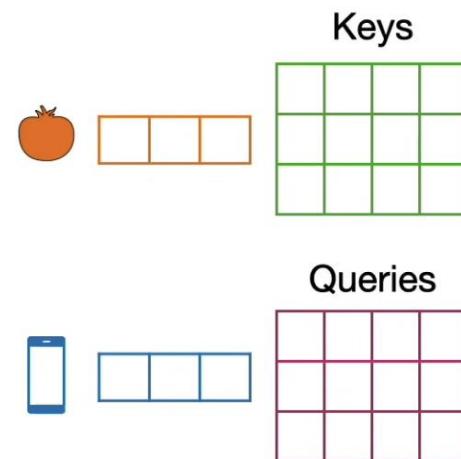

$$\text{Similarity}(\text{orange}, \text{blue}) = \begin{matrix} \text{orange} \\ \text{blue} \end{matrix}$$

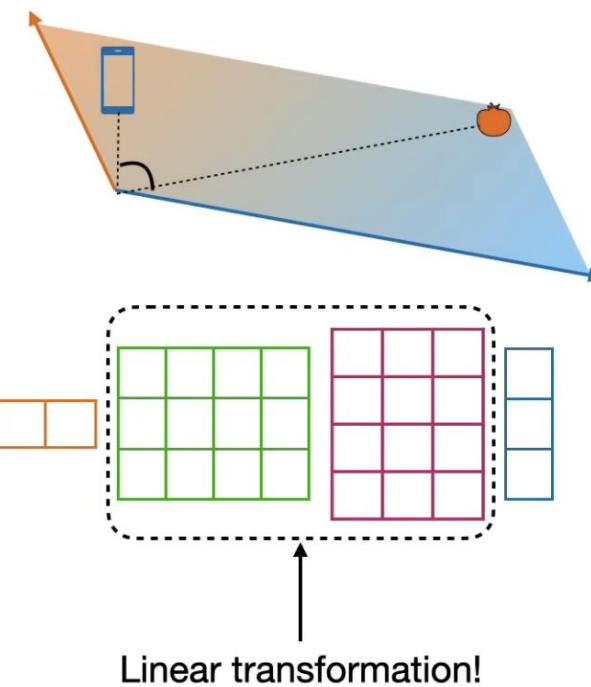

The equation shows the similarity between the orange fruit and the blue smartphone, represented by a bracket containing their respective vectors.

Un nuevo embedding

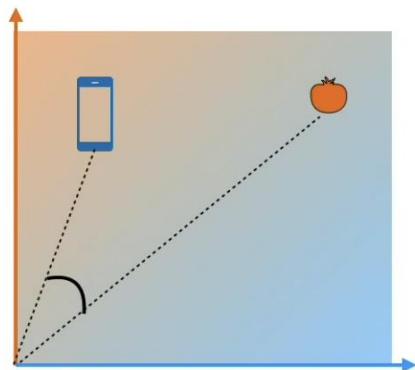

Keys and Queries Matrices

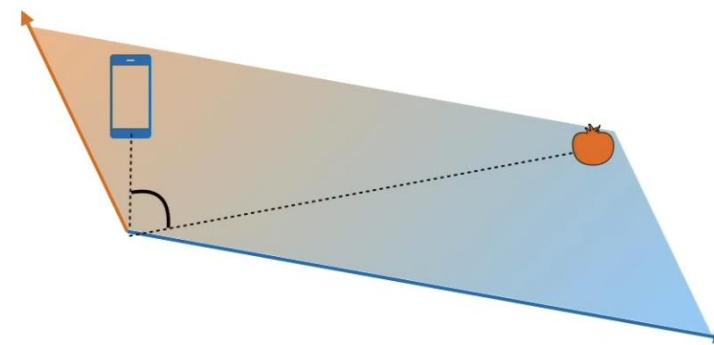

Similarity (,) =

Similarity on a transformed embedding

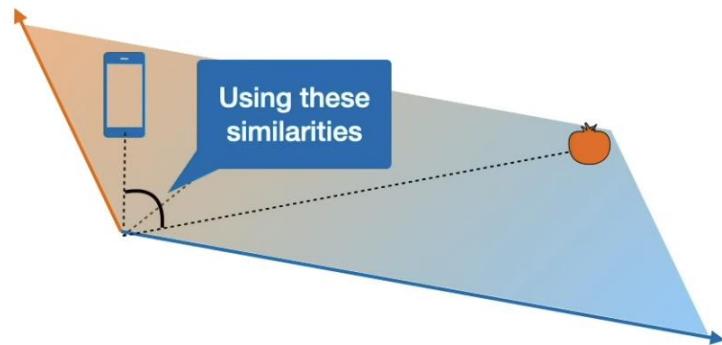

$$\text{Similarity}(\text{Tomato}, \text{Smartphone}) = \begin{matrix} \text{orange} \\ \text{square} \\ \text{matrix} \end{matrix} \quad \begin{matrix} \text{blue} \\ \text{square} \\ \text{matrix} \end{matrix}$$

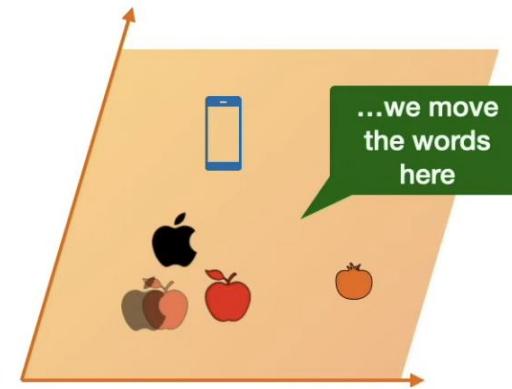

$$\text{Similarity}(\text{Tomato}, \text{Smartphone}) = \begin{matrix} \text{orange} \\ \text{square} \\ \text{matrix} \end{matrix} \quad \begin{matrix} \text{green} \\ \text{square} \\ \text{matrix} \end{matrix} \quad \begin{matrix} \text{purple} \\ \text{square} \\ \text{matrix} \end{matrix} \quad \begin{matrix} \text{blue} \\ \text{square} \\ \text{matrix} \end{matrix}$$

Y la idea es que attention funcione mejor en este nuevo embedding

Values matrix

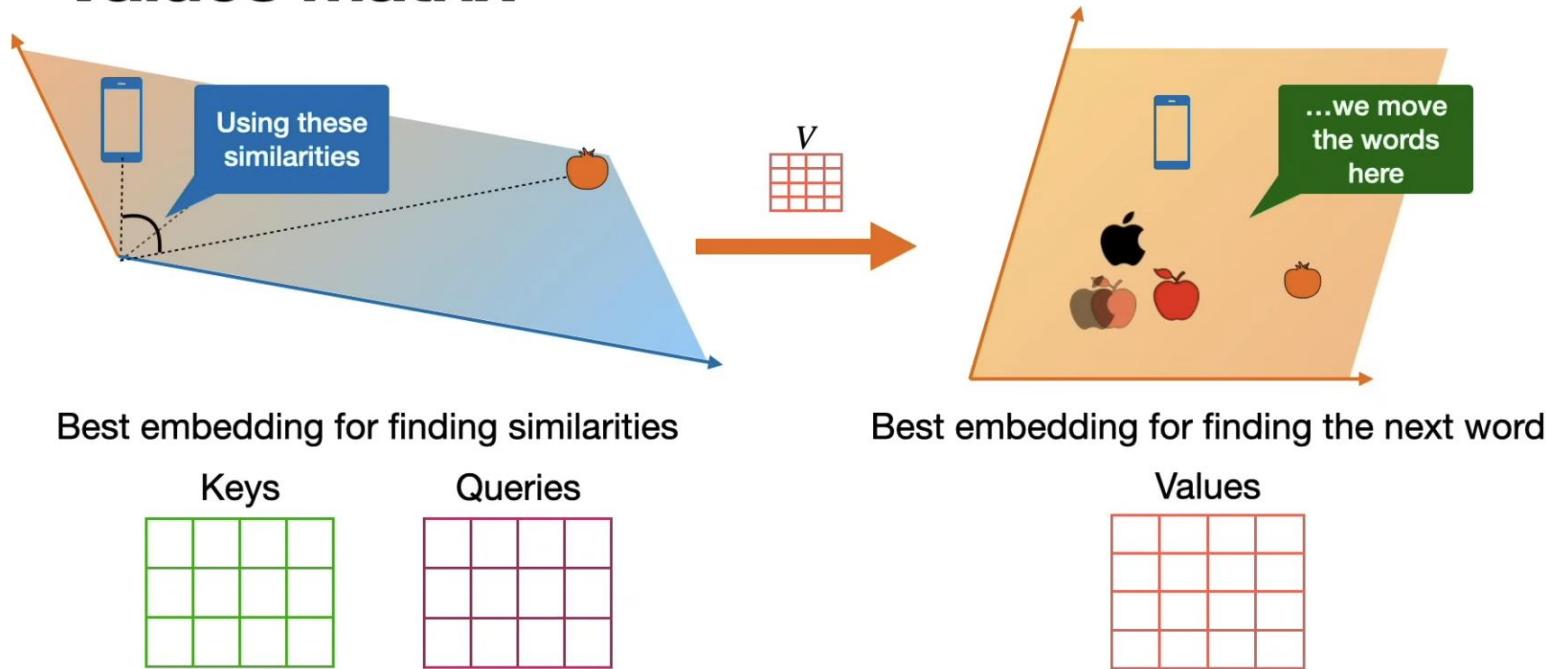

Best embedding for finding similarities

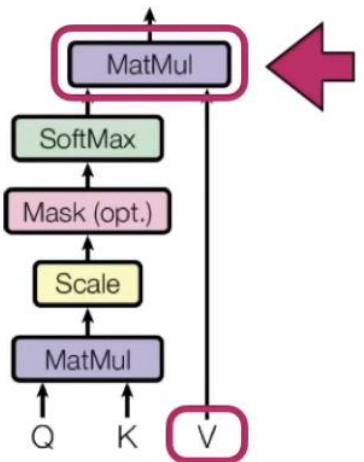

Best embedding for finding the next word

Values matrix

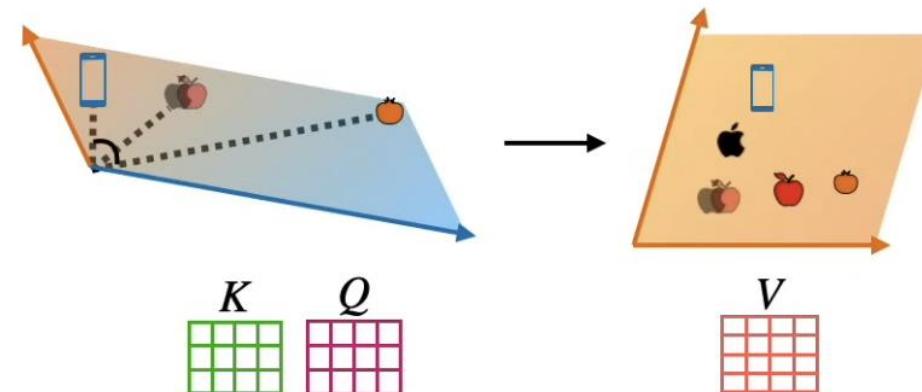

Self-attention

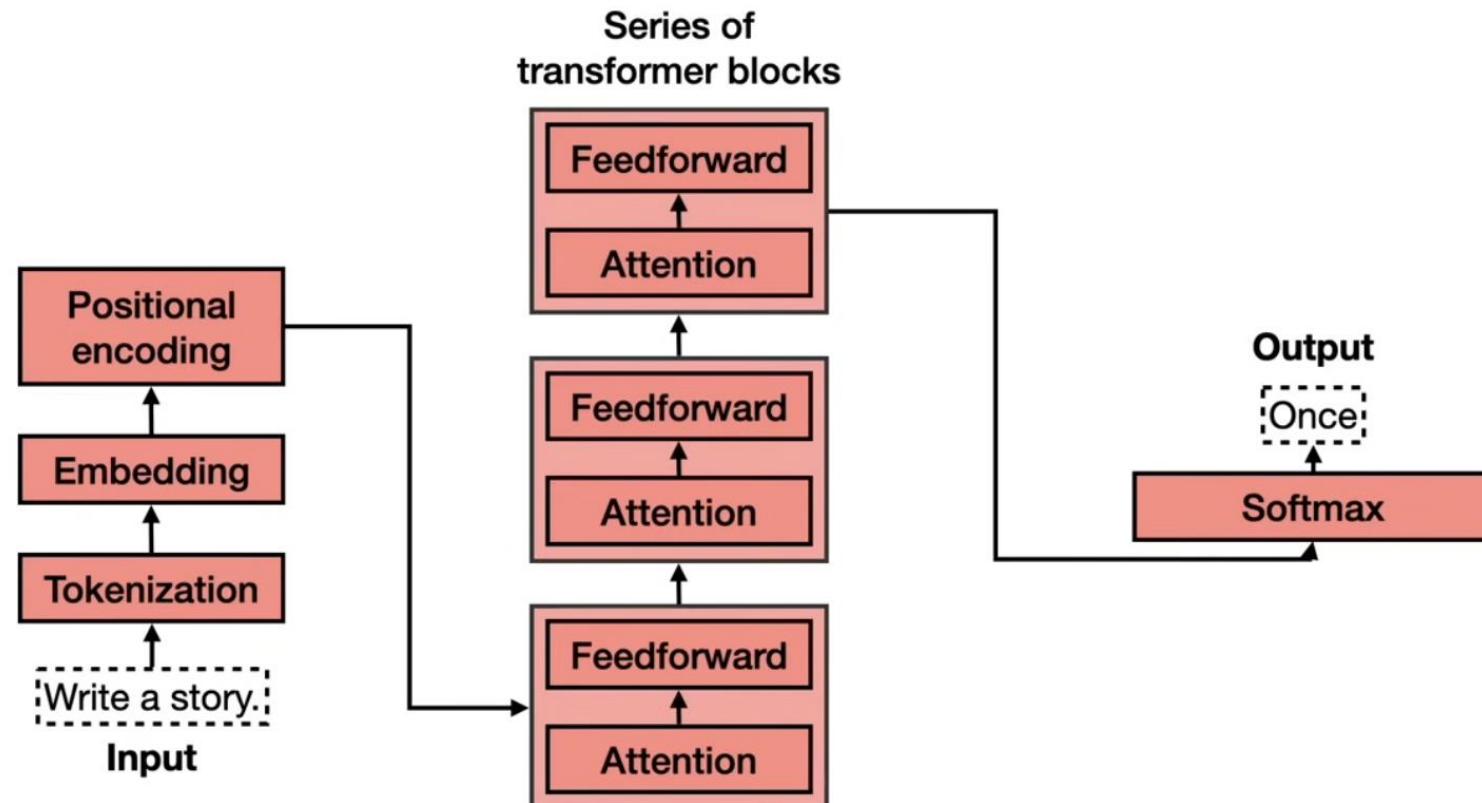

Scaled Dot-Product Attention

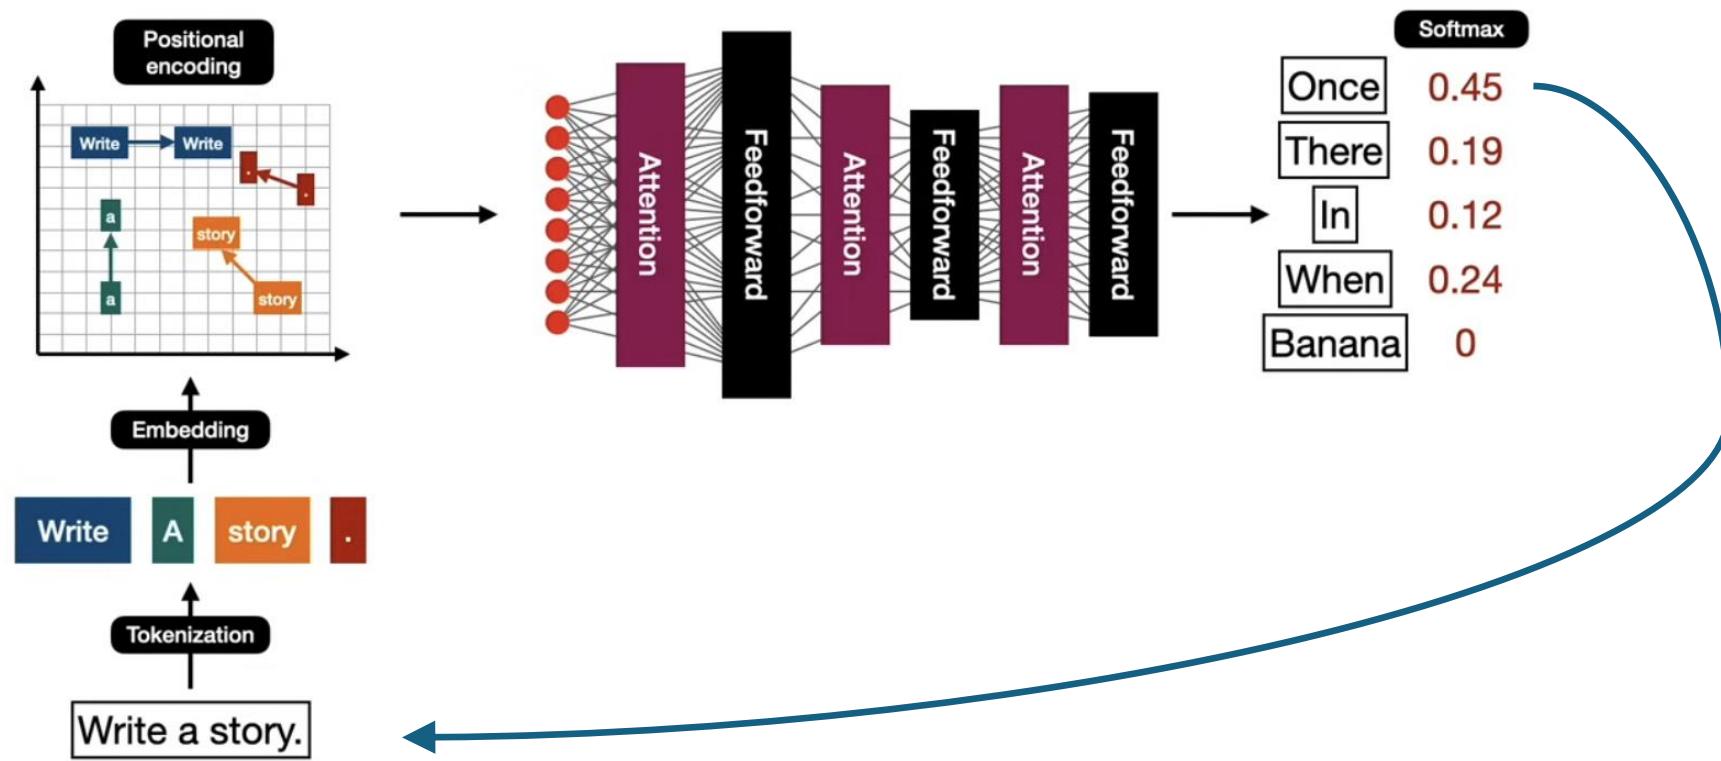

$$\text{Attention}(Q, K, V) = \text{softmax}\left(\frac{QK^T}{\sqrt{d_k}}\right)V$$

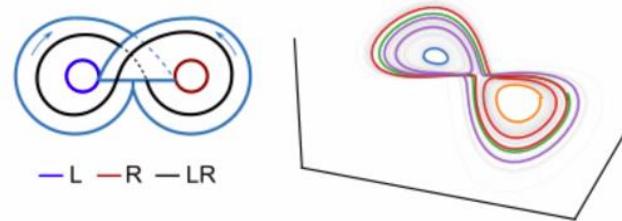

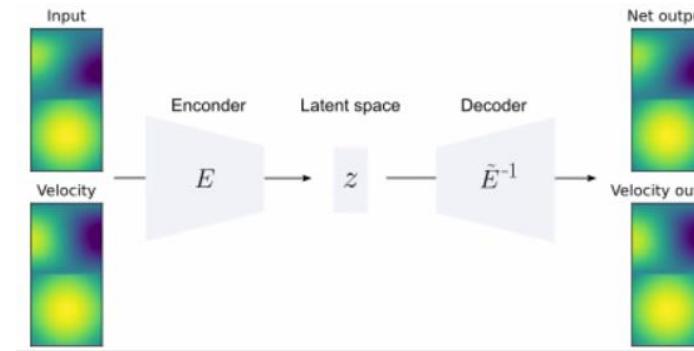

Transformers... predicción, palabra por palabra.

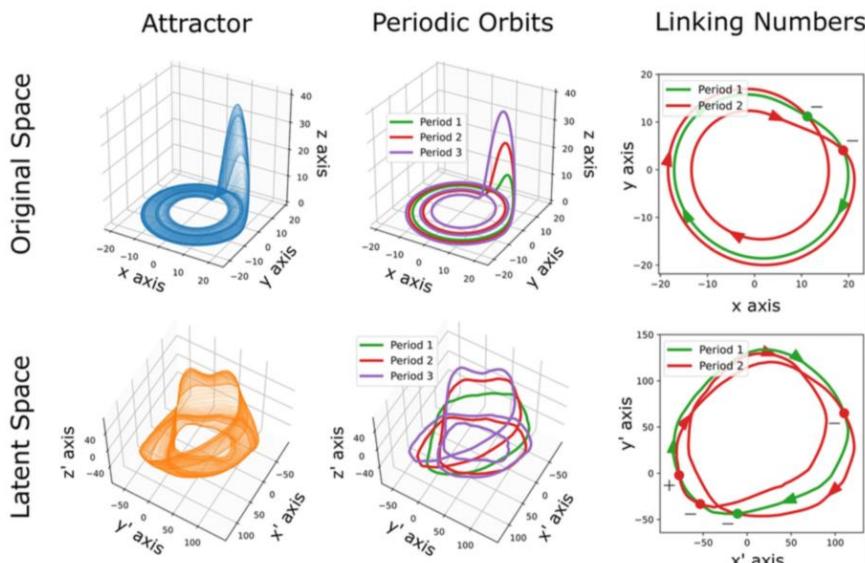

The picture that emerges is that the neural networks used in different implementations of IA projects, do recreate the original flow of the dynamics.

AE trained with movie

AE trained with temporal data

RNN trained with temporal data
